PROJECTS

Food-website/Minor Project
Aim of this project is to develop a website for online food management. Here the customer can order the food from the restaurant at the same time they can customize their own food orders as per their choice.In addition, it offers the customers advice about the health systems and some special diets. This service offers health notes about certain food orders. Some orders do not fit certain people. For example, if certain food order contains carbohydrates, the web-site alerts the diabetic person that this order contains sugars that might be seriously dangerous to him/her.
